

**Our products  
are developed  
for your needs**

We monitor our air springs at every stage from production to usage, thanks to the barcode system supported by **TÜBİTAK**.

We produce our pistons with composite materials as well as with metals. This gives us the possibility to present lighter but stronger products to our customers.

Just tell us the brand of your vehicle. You will definitely find the air spring you are looking for at Airtech, thanks to our wide product range.

Our air springs are OEM certified.

**Your safety  
is our concern**

We manufacture defect free products that always have high performance, thanks to our 25 different tests.

We manufacture air springs that are able to endure not to 6 or 7 but to 21 bars of pressure. We put them under tests to ensure that they will not let you down between - 40°C and + 70°C.

We test our air springs in a simulator, which is based on real road conditions. Airtech air springs tested in the machinery, which is supported by **TÜBİTAK** and patented by us, will not let you down even under the hardest road conditions.

Our high quality is also certified by international certification body **DEKRA** and our air springs are the only ones that passed a test of 2,000,000 cycles.
